

John Doe

Senior Backend Engineer | Distributed Systems, Cloud Architecture & Observability

San Francisco, CA, USA john.doe@example.com (415) 555-0192
johndoe-example johndoe-example @johndoe_example

About

Senior Backend Engineer with a strong systems background in designing fault-tolerant distributed systems, high-throughput APIs, and asynchronous data processing pipelines. Specialized in Python (Asyncio, FastAPI), resilience architectural patterns (Backpressure, Graceful Degradation), and end-to-end observability (Prometheus, OpenTelemetry, Grafana). Passionate about clean code, robust system design, and building infrastructure that scales smoothly under load.

Experience

Acme Cloud Analytics Inc., Senior Backend / Distributed Systems Engineer — San Francisco, CA (Remote)
2022 – present

Development of core backend services and event-driven data streaming platform.

- Microservice Architecture: engineered asynchronous backend services in FastAPI/Python processing 50M+ requests daily.
- Data Integrity & Anti-Abuse: designed and deployed real-time validation pipelines reducing fraudulent traffic and bot requests by 45%.
- Distributed Storage: optimized real-time sync and data transformation across PostgreSQL, ClickHouse, and Redis.
- Observability & SLA: configured structured telemetry and latency dashboards, reducing mean-time-to-recovery (MTTR) by 35%.

Global Tech Solutions LLC, Software & Automation Engineer | Tech Lead — Austin, TX
2019 – 2022

Engineering software development, data pipelines automation, and cloud infrastructure deployment.

- Data Pipelines: developed Python ETL pipelines for automated auditing and data reconciliations, processing terabytes of transactional records.
- Process Automation: created a suite of internal CLI tools and automated integration workflows, cutting release cycle times by 40%.
- Edge Networking: architected secure VPN tunneling, custom routing tables, and load balancing across multi-region server clusters.
- Quality Assurance: introduced automated data verification and comprehensive test suites, increasing build reliability to 99.8%.

Precision Systems Corp, Systems Engineer — Seattle, WA
2017 – 2019

Systems monitoring and performance optimization for critical production infrastructure.

- Telemetry & Incident Response: managed 24/7 telemetry monitoring of critical services with early diagnostic alerting.
- High-Reliability Standards: adhered to strict high-availability SLA compliance and disaster recovery protocols.

Projects

Distributed Event Ingestion Platform (Open Source)

High-throughput event ingestion and stream buffering service (FastAPI, RabbitMQ, Redis).

- Clean Architecture: designed according to 12-Factor principles, domain-driven design, and non-blocking I/O.
- Resilience & Flow Control: implemented Dead-Letter Queues (DLQ), exponential backoff retries, and rate limiting.

High-Frequency Data Aggregator

Low-latency telemetry and market data processing pipeline (100ms streaming interval).

- Storage Tuning: hybrid storage scheme (TimescaleDB + Parquet) with optimized disk I/O and batch flushing.
- Full Observability: comprehensive metric, log, and trace instrumentation with OpenTelemetry and Grafana dashboards.

Skills

Backend & Architecture: Python (Asyncio, FastAPI), Event-Driven Architecture, Pydantic, SQLAlchemy, Redis, Celery, REST, WebSockets

Data & Databases: PostgreSQL, ClickHouse, Redis, RabbitMQ, TimescaleDB, MongoDB, Apache Parquet

Observability & Reliability: Prometheus, VictoriaMetrics, Vector, OpenTelemetry, Grafana, Structured Logging, Distributed Tracing

DevOps & Infrastructure: Docker, Docker Compose, Linux Admin, CI/CD (GitHub Actions), Bash, Nginx, Networking (TCP/IP, DNS)

Education

State University of Technology Seattle, WA
Bachelor of Science, Computer Science & Software Engineering 2013 – 2017

- Focus: Distributed algorithms, database systems, computer networking, and operating systems.
